## **FCC RF Test Report**

APPLICANT : Green Packet Berhad, Taiwan

**EQUIPMENT**: LTE Band 7 Outdoor CPE

BRAND NAME : Green Packet

MODEL NAME : OF-250

FCC ID : W9V-OF250-GP STANDARD : 47 CFR Part 2, 27

**CLASSIFICATION**: Licensed Non-Broadcast Station Transmitter (TNB)

The product was received on May 09, 2014 and testing was completed on Jun. 06, 2014. We, SPORTON INTERNATIONAL INC., would like to declare that the tested sample has been evaluated in accordance with the test procedures given in ANSI / TIA / EIA-603-C-2004 and the testing has shown the tested sample to be in compliance with the applicable technical standards.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC., the test report shall not be reproduced except in full.

## 1 General Description

## 1.1 Applicant

#### Green Packet Berhad, Taiwan

6F, No.21, Lane 583, Rueiguang Rd. Neihu District, Taipei City 11492, Taiwan

## 1.2 Manufacturer

#### Green Packet Berhad, Taiwan

6F, No.21, Lane 583, Rueiguang Rd. Neihu District, Taipei City 11492, Taiwan

## 1.3 Product Feature of Equipment Under Test

	Product Feature
Equipment	LTE Band 7 Outdoor CPE
Brand Name	Green Packet
Model Name	OF-250
FCC ID	W9V-OF250-GP
EUT supports Radios application	LTE
HW Version	A1
SW Version	OF-250_e37i
EUT Stage	Production Unit

Report No. : FG450931

**Remark:** The above EUT's information was declared by manufacturer. Please refer to the specifications or user's manual for more detailed description.

## 1.4 Product Specification subjective to this standard

Product Specification subjective to this standard									
Tx Frequency	LTE Band 7: 2502.5 MHz ~ 2567.5 MHz								
Rx Frequency	LTE Band 7: 2622.5MHz ~ 2687.5 MHz								
Bandwidth	LTE Band 7: 5MHz/10MHz/15MHz/20MHz								
Maximum Output Power to Antenna	LTE Band 7: 21.66 dBm								
Antenna Type	PATCH Antenna								
Antenna Gain	LTE Band 7 :11.00 dBi								
Type of Modulation	QPSK / 16QAM								

## 1.5 Modification of EUT

No modifications are made to the EUT during all test items.

Took Cito No	Sporton	Site No.					
Test Site No.	TH02-HY	03CH07-HY					

## 1.8 Applicable Standards

According to the specifications of the manufacturer, the EUT must comply with the requirements of the following standards:

- 47 CFR Part 2, 27
- ANSI / TIA / EIA-603-C-2004
- FCC KDB 971168 D01 Power Meas. License Digital Systems v02r01
   FCC KDB 412172 D01 Determining ERP and EIRP v01

## Remark:

- 1. All test items were verified and recorded according to the standards and without any deviation during the test.
- 2. This EUT has also been tested and complied with the requirements of FCC Part 15, Subpart B, recorded in a separate test report.

Report Version : Rev. 02

Report Template No.: BU5-FGLTE Version 1.1

## 2 Test Configuration of Equipment Under Test

## 2.1 Test Mode

Antenna port conducted and radiated test items listed below are performed according to KDB 971168 D01 Power Meas. License Digital Systems v02r01 with maximum output power.

Radiated measurements are performed by rotating the EUT in three different orthogonal test planes to find the maximum emission.

			В	andwic	lth (MH	lz)		Modu	lation		RB#		Tes	t Chan	nel
Test Items	Band	1.4	3	5	10	15	20	QPSK	16QAM	1	Half	Full	L	М	Н
Max. Output Power	7	-	-	v	V	v	V	V	v	v	v	v	V	v	v

Conducted Spurious Emission	7	-	-	V	V	v	V	V	v	v				V	
Frequency Stability	7	-	-		V			V				v		V	
E.R.P./ E.I.R.P.	7	-	-	v			v	v	v	v			v	y	γ
Radiated Spurious Emission	7	-	-	V	V	v	y	V		v				V	
Note	<ol> <li>The mark "v" means that this configuration is chosen for testing</li> <li>The mark "-" means that this bandwidth is not supported.</li> <li>For E.R.P/E.I.R.P. measurement, the widest bandwidth of each band is chosen for testing due to highest conducted power. Besides, the lowest bandwidth of each band is also measured for reporting only.</li> <li>The device is investigated from 30MHz to 10 times of fundamental signal for radiated spurious emission test under different RB size/offset and modulations in exploratory test. Subsequently,</li> </ol>

## 2.2 Connection Diagram of Test System

## 2.3 Support Unit used in test configuration and system

Item	Equipment	Trade Name	Model No.	FCC ID	Data Cable	Power Cord
1.	LTE Base Station	Anritsu	MT8820C	N/A	N/A	Unshielded, 1.8 m

## 2.4 Measurement Results Explanation Example

#### For all conducted test items:

The offset level is set in the spectrum analyzer to compensate the RF cable loss and attenuator factor between EUT conducted output port and spectrum analyzer. With the offset compensation, the spectrum analyzer reading level is exactly the EUT RF output level.

The spectrum analyzer offset is derived from RF cable loss and attenuator factor.

Offset = RF cable loss + attenuator factor.

Following shows an offset computation example with cable loss 4.2 dB and 10dB attenuator.

## Example:

Offset(dB) = RF cable loss(dB) + attenuator factor(dB).  
= 
$$4.2 + 10 = 14.2$$
 (dB)

## 3 Test Result

## 3.1 Conducted Output Power Measurement and ERP/EIRP Measurement

## 3.1.1 Description of the Conducted Output Power Measurement and ERP/EIRP Measurement

A system simulator was used to establish communication with the EUT. Its parameters were set to force the EUT transmitting at maximum output power. The measured power in the radio frequency on the transmitter output terminals shall be reported.

The EIRP of mobile transmitters must not exceed 2 Watts for LTE Band 7.

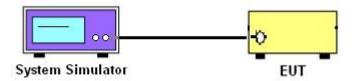

## 3.1.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

#### 3.1.3 Test Procedures

- 1. The transmitter output port was connected to the system simulator.
- 2. Set EUT at maximum power through the system simulator.
- 3. Select lowest, middle, and highest channels for each band and different modulation.
- 4. Measure and record the power level from the system simulator.

## 3.1.4 Test Setup

## 3.2 Peak-to-Average Ratio

## 3.2.1 Description of the PAR Measurement

Power Complementary Cumulative Distribution Function (CCDF) curves provide a means for characterizing the power peaks of a digitally modulated signal on a statistical basis. A CCDF curve depicts the probability of the peak signal amplitude exceeding the average power level. Most contemporary measurement instrumentation include the capability to produce CCDF curves for an input signal provided that the instrument's resolution bandwidth can be set wide enough to accommodate the entire input signal bandwidth. In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

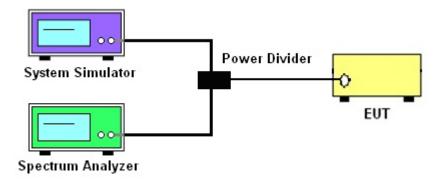

## 3.2.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

### 3.2.3 Test Procedures

- 1. The EUT was connected to spectrum and system simulator via a power divider.
- 2. Set the CCDF (Complementary Cumulative Distribution Function) option in spectrum analyzer.
- 3. The highest RF powers were measured and recorded the maximum PAPR level associated with a probability of 0.1 %.
- 4. Record the deviation as Peak to Average Ratio.

## 3.3 Occupied Bandwidth

## 3.3.1 Description of Occupied Bandwidth Measurement

The occupied bandwidth is the width of a frequency band such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to a specified percentage 0.5% of the total mean transmitted power.

The 26 dB emission bandwidth is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated 26 dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth equal to approximately 1.0% of the emission bandwidth.

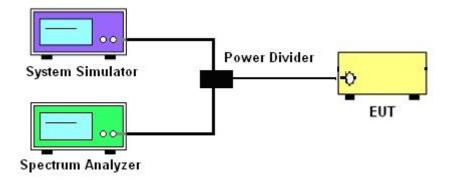

## 3.3.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

#### 3.3.3 Test Procedures

- 1. The EUT was connected to spectrum analyzer and system simulator via a power divider.
- The 26dB and 99% occupied bandwidth (BW) of the middle channel for the highest RF power with full RB sizes were measured.

## 3.4 Conducted Band Edge Measurement

## 3.4.1 Description of Conducted Band Edge Measurement

27.53 (I)(4) and RSS - 199

The emissions be operated in the 2496-2690 MHz band, the attenuation factor of transmitter Power (P) shall be not less than 55 + 10 log (P) dB at the channel edge

\*The test limit in the test data chooses worse limit to make sure test data is fine for different kinds of product, the real limit for fixed digital user station should be 43 + 10logP(W).

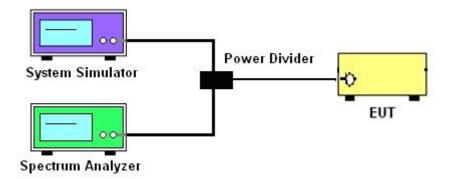

## 3.4.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

#### 3.4.3 Test Procedures

- 1. The EUT was connected to spectrum analyzer and system simulator via a power divider.
- The band edges of low and high channels for the highest RF powers were measured. Set RBW
   = 1% EBW in the 1MHz band immediately outside and adjacent to the band edge.
- 3. Set spectrum analyzer with RMS detector.
- 4. The RF fundamental frequency should be excluded against the limit line in the operating frequency band.
- 5. The limit line is derived from 43 + 10log(P)dB below the transmitter power P(Watts)
  - = P(W) [43 + 10log(P)] (dB)
  - = [30 + 10log(P)] (dBm) [43 + 10log(P)] (dB)
    - = -13dBm.

## 3.5 Conducted Spurious Emission Measurement

## 3.5.1 Description of Conducted Spurious Emission Measurement

The power of any emission outside of the authorized operating frequency ranges must be lower than the transmitter power (P) by a factor of at least 43 + 10 log (P) dB.

For Band 7

It is measured by means of a calibrated spectrum analyzer and scanned from 30MHz up to a frequency including its 10<sup>th</sup> harmonic.

\*The test limit in the test data chooses worse limit to make sure test data is fine for different kinds of product. the real limit for fixed digital user station should be 43 + 10logP(W).

## 3.5.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

#### 3.5.3 Test Procedures

- 1. The EUT was connected to spectrum analyzer and system simulator via a power divider.
- The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator.
   The path loss was compensated to the results for each measurement.
- 3. The middle channel for the highest RF power within the transmitting frequency was measured.
- 4. The conducted spurious emission for the whole frequency range was taken.
- 5. Make the measurement with the spectrum analyzer's RBW = 1MHz, VBW = 3MHz, taking the record of maximum spurious emission.
- 6. The RF fundamental frequency should be excluded against the limit line in the operating frequency band.
- 7. The limit line is derived from 43 + 10log(P)dB below the transmitter power P(Watts)
  - = P(W) [43 + 10log(P)] (dB)
  - = [30 + 10log(P)] (dBm) [43 + 10log(P)] (dB)
  - = -13dBm.
- 8. For Band 7

The limit line is derived from 55 + 10log(P)dB below the transmitter power P(Watts)

### 3.6 Radiated Spurious Emission Measurement

### 3.6.1 Description of Radiated Spurious Emission

The radiated spurious emission was measured by substitution method according to ANSI / TIA / EIA-603-C-2004. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitter power (P) by a factor of at least 43 + 10 log (P) dB.

For Band 7

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitter power (P) by a factor of at least 55 + 10 log (P) dB.

The spectrum is scanned from 30 MHz up to a frequency including its 10th harmonic.

\*The test limit in the test data chooses worse limit to make sure test data is fine for different kinds of product. the real limit for fixed digital user station should be 43 + 10logP(W).

### 3.6.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

#### 3.6.3 Test Procedures

- 1. The EUT was placed on a rotatable wooden table with 0.8 meter above ground.
- 2. The EUT was set 3 meters from the receiving antenna, which was mounted on the antenna tower.
- 3. The table was rotated 360 degrees to determine the position of the highest spurious emission.
- 4. The height of the receiving antenna is varied between one meter and four meters to search the maximum spurious emission for both horizontal and vertical polarizations.
- 5. Make the measurement with the spectrum analyzer's RBW = 1MHz, VBW = 3MHz, taking the record of maximum spurious emission.
- 6. A horn antenna was substituted in place of the EUT and was driven by a signal generator.
- 7. Tune the output power of signal generator to the same emission level with EUT maximum spurious emission.
- 8. Taking the record of output power at antenna port.
- 9. Repeat step 7 to step 8 for another polarization.
- 10. The RF fundamental frequency should be excluded against the limit line in the operating frequency band.

The limit line is derived from 43 + 10log(P)dB below the transmitter power P(Watts)

- = P(W) [43 + 10log(P)] (dB)
- = [30 + 10log(P)] (dBm) [43 + 10log(P)] (dB)
- = -13dBm.

For Band 7

The limit line is derived from 55 + 10log(P)dB below the transmitter power P(Watts)

11. EIRP (dBm) = S.G. Power – Tx Cable Loss + Tx Antenna Gain

### 3.7 Frequency Stability Measurement

#### 3.7.1 Description of Frequency Stability Measurement

The frequency stability shall be measured by variation of ambient temperature and variation of primary supply voltage to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within ±0.00025% (±2.5ppm) of the center frequency.

### 3.7.2 Measuring Instruments

The measuring equipment is listed in the section 4 of this test report.

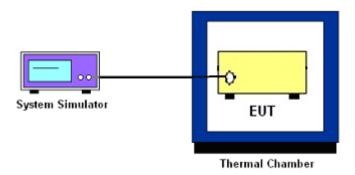

### 3.7.3 Test Procedures for Temperature Variation

- 1. The EUT was set up in the thermal chamber and connected with the system simulator.
- With power OFF, the temperature was decreased to -30°C and the EUT was stabilized before testing. Power was applied and the maximum change in frequency was recorded within one minute.
- 3. With power OFF, the temperature was raised in 10°C step up to 50°C. The EUT was stabilized at each step for at least half an hour. Power was applied and the maximum frequency change was recorded within one minute.

#### 3.7.4 Test Procedures for Voltage Variation

- 1. The EUT was placed in a temperature chamber at 25±5° C and connected with the system simulator.
- 2. The power supply voltage to the EUT was varied from 85% to 115% of the nominal value measured at the input to the EUT.
- 3. The variation in frequency was measured for the worst case.

#### 3.7.5 Test Setup

### 3.7.6 Test Result of Temperature Variation (FCC)

Band: LTE Band 7 (QPSK)	Limit (ppm):	2.5
-------------------------	--------------	-----

	BW 10MHz	
Temperature (°C)	Deviation (ppm)	Result
50	0.0010	
40	0.0001	
30	0.0115	
20(Ref.)	0.0000	
10	0.0108	PASS
0	0.0102	
-10	0.0013	
-20	0.0106	
-30	0.0100	

## 3.7.7 Test Result of Voltage Variation (FCC)

Band	Bandwidth	Voltage Deviation (Volt) (ppm)		Limit (ppm)	Result
		240.00 0.0014			
LTE Band 7	10M	Normal	0.0113	2.5	PASS
		100.00	0.0110		

### Remark:

- 1. Normal Voltage = 230.00V.
- 2. The manufacturer declared that the EUT could work properly between voltage  $100.00V \sim 240.00V$ .
